equation $|x| = 3$ is $\{3, -3\}$, because $|3| = 3$ and $|-3| = 3$. Example 1.

Solve for x : $|4x - 2| = 8$.

This translates to “ $4x - 2$ is 8 units from zero on the number line” (see Figure 2). Check the solution. These are true statements.

following general formula for equations involving absolute

value. If $|p| = b$, $b > 0$ then $p = -b$ or $p = b$. If $|p| = b$, $b > 0$ then $p = -b$ or $p = b$. Notice that this does require the b be a positive number. We will deal with what happens if b is zero or negative in a bit.

Value Equations

Solving Absolute Value Equations For most absolute value

equations, you will need to write two equations to solve. Therefore, you will most likely end up with two answers to the equation. The answer to an absolute value equation can never be negative.

To make the absolute value term positive, both sides are multiplied by (-1). $2|c-50| = 60$.

Step 2 : Clear the Absolute Value Bars. Clear the absolute-value bars by splitting the equation into its two cases, one for the Positive case and the other for the Negative case. The Absolute Value term is $2|c-50|$

values that can be

useful: $|a| \geq 0$ always!

That makes sense ... $|a|$

can never be less than

zero. $|a| = \sqrt{a^2}$

Squaring a makes it

positive or zero (for a as

a Real Number). Then

taking the square root

will "undo" the

squaring, but leave it

positive or zero. $|a \times b|$

$= |a| \times |b|$.

Absolute Value in

Algebra - MATH

Absolute value equations are equations

where the variable is within an absolute value operator, like $|x-5|=9$.

The challenge is that the absolute value of a number depends on the number's sign: if it's positive, it's equal to the number: $|9|=9$. If the number is negative, then
