body. Basically, immune system is a complex network of lymphoid organs, tissues and cells.

Biology Notes on Immune System | Immunology
Immune systems All animals, including humans, have innate immune systems, which consist of the first and second line of defence measures. The innate immune systems are active continuously or immediately upon infection and the responses occurring as a part of it are the same whether or not the pathogen has been encountered previously.

The immune system is a host defense system. It comprises many biological structures - ranging from individual white blood cells to entire organs - as well as many complex biological processes. The function of the immune system is to protect the host from pathogens and other causes of disease such as tumor cells.

Guided
The immune system has two "arms"; innate immunity which detects components shared by all pathogens and adaptive immunity which detects components specific to individual pathogens. Mellman explains how these two "arms" work and the important role of dendritic cells in linking the two "arms" together.

Biology Revision

The immune system distinguishes self from nonself and eliminates potentially harmful nonself molecules and cells from the body. The immune system also has the capacity to recognize and destroy abnormal cells that derive from host tissues. Any molecule capable of being recognized by the immune system is considered an antigen (Ag).
