C# 7.0 allows other types to be defined in such a way that they can be returned from an async method. For instance we plan to have a ValueTask<T> struct type. It is built to prevent the allocation of a Task<T> object in cases where the result of the async operation is already available at the time of awaiting. For many async scenarios where buffering is involved for example, this can drastically reduce the number of allocations and lead to significant performance gains.

@unwind: note also that 0 is an octal integer constant, and is a special case of the fact that in general one can write 0[0-7]* for an octal integer constant. Not that it makes any difference whether 0 is formally defined to be an octal vs decimal constant, but as it happens the grammar classifies it as octal, as it does the \0 escape :-)
