Handout 2: Global properties of plane curves. Definitions. A plane curve $\gamma: [a,b] \rightarrow \mathbb{R}^2$ is closed if $\gamma(a) = \gamma(b)$. It is immersed if $\gamma'(t) \neq 0$ for any $t \in [a,b]$. Let $p \in \mathbb{R}^2$ be a point not on the curve γ . The winding number $w_\gamma(p)$ of an oriented closed curve γ around p is

curve C over K is a hypersurface in $A^2(K)$. Thus, it is an affine algebraic set defined by a non-constant polynomial f in $K[x,y]$. By Hilbert's Nullstellensatz the squarefree part of f defines the same curve C , so we might as well require the defining polynomial to be squarefree. Definition 7.1.1.

Since $\kappa = 0$, γ is a plane curve. What we must now show is that every point of γ is at distance $1/\kappa$ from some fixed point γ which will thus be the center of the circle. Consider the curve $\gamma = \gamma + (1/\kappa)N$. Using the hypothesis on γ , and (as usual) a Frenet formula, we find
