The menstrual phase occurs at the very beginning of the uterine cycle. It only occurs if no ovum is fertilised. The process begins with the breakdown of the corpus luteum which therefore ceases to produce progesterone. The loss of progesterone causes vasoconstriction of the spiral arteries supplying the functional layer of the endometrium.

The hidden intelligence of hormones and their role in empowering women to succeed sexually, reproductively, and socially. Did you know women walk more, eat less, socialize more, meet more men, dance more, and flirt more when they're ovulating? Or that PMS may have evolved to get rid of boyfriends with unfit sperm? Behind the "fickle" differences in what women find sexy about men, or what they like to wear, there's a hidden adaptive intelligence that has been shaped over eons. In this provocative and paradigm-shattering book, Martie Haselton, the world's leading researcher on sexuality and the ovulation cycle, takes a deep, revealing look at the biological processes that so profoundly influence our behavior and sets forth a radical new understanding of women's bodies, minds, and sexual relationships, one that embraces hormonal cycles as adaptive solutions to genuine biological challenges. At the core of Hasleton's new Darwinian feminism is her remarkable discovery that humans, like our animal cousins, possess a special phase of sexuality, called estrus, which comes with a host of physiological and behavioral changes. Rigorously researched, entertaining, and empowering, Hormonal offers women deep new insights into their bodies, brains, relationships, and affairs, allowing them to make better-informed choices about sex, marriage, friendship, contraception, and more. Above all, Hormonal is a clarion call to appreciate and embrace the genius of female biology.

The reproductive cycle in women is complex and can be considered to begin with epigenetic programming and ending with menopause. Intervening steps involve a variety of processes, including the cellular development of the sex organs, menarche, episodic endocrine cycles, menstruation, ovulation and conception. These processes can be influenced by diet and nutrition and vice versa. Body composition has an impact on the menstrual cycle and periconception and these factors in turn also influence body composition. Similarly, either food deprivation, dietary excess or obesity can result in marked changes in the menstrual cycle with a concomitant effect on fertility. This handbook is the first scientific source that provides a comprehensive overview of the relationship of diet and nutrition with puberty, menarche and menstrual cycle, conception and fertility and infertility. The handbook of diet and nutrition in the menstrual cycle, conception and fertility will benefit dieticians, nutritionists, gynaecologists, endocrinologists, obstetricians, paediatricians and those concerned with women's health in general.

What do you know about your menstrual cycle? Your menstrual cycle is your fifth vital sign – a barometer of health and wellness that is as telling as your pulse or blood pressure. Yet most of us see our periods as nothing more than a source of inconvenience and embarrassment. The reasons for this are vast and complex and many are rooted in misogyny. The fact is, women the world over are taught the bare minimum about menstruation, and the messages they do receive are negative: that periods are painful and gross, that they turn us into hormonal messes, and that they shouldn't be discussed. By examining the history of period shame and stigma and its effects on women's health and wellness today as well as providing a crash course in menstrual self-care, Heavy Flow aims to lift the veil on menstruation, breaking the "curse" once and for all.
