It was to be designed like a large pylon with four columns of lattice work girders, separated at the base and coming together at the top, and joined to each other by more metal girders at regular intervals. The tower project was a bold extension of this principle up to a height of 300 metres - equivalent to the symbolic figure of 1000 feet. On September 18 1884 Eiffel registered a patent "for a new configuration allowing the construction of metal supports and pylons capable of exceeding a ...

The Eiffel Tower stands on four lattice-girder piers that taper inward and join to form a single large vertical tower. As they curve inward, the piers are connected to each other by networks of girders at two levels that afford viewing platforms for tourists. By contrast, the four semicircular arches at the tower's base are purely aesthetic elements that serve no structural function.

Eiffel Tower | History, Height, & Facts | Britannica

Tuesday, August 18, 2009 - 17:30. Jason Socrates Bardi, Editor. (Inside Science) -- A new engineering analysis of the Eiffel Tower in Paris shows what the famous landmark would have looked like if its builder had constructed the tower to take into account more realistic wind profiles. The design was revolutionary 120 years ago, incorporating engineer Gustave Eiffel's newly patented methods for constructing freestanding structures of great height.
